

Installing PM4PY on macOS

You can choose between an Docker image or the classical installation process.

1. Installation via Docker

A Docker image is available on the Docker hub and could be retrieved through the command.

```
docker pull javert899/pm4py:latest
```

It could be then run through the following command.

```
docker run -it javert899/pm4py:latest bash
```

2. Classical Installation

This section provides you help to run PM4Py without using Docker.

a. Install Anaconda/Miniconda

Anaconda 2020.07 (if not already installed; it is not necessary if Miniconda is installed) could be retrieved by [clicking here](#).

Miniconda (if not already installed; it is not necessary if Anaconda is installed) could be retrieved by [clicking here](#).

b. Install the PM4Py package

In order to install PM4Py and its dependencies, the following command could be provided:

```
pip install pm4py
```

To check if everything is done correctly, the following command can be used.

```
python -c "import pm4py"
```
